NEW CAPABILITY

PRIVATE AI, BUILT INTO THE INFRASTRUCTURE YOU ALREADY RUN

We deploy open-source AI inside your network on hardware you own: local language models, plus search over your own documents. Nothing leaves your network, and nothing depends on an outside connection.

YOUR HARDWARE · YOUR BOUNDARY · FULLY AIR-GAPPED · NO APPLIANCE TO BUY

THE PROBLEM WHY THE USUAL OPTIONS DON'T FIT

01

CLOUD AI IS OFF THE TABLE

CUI and classified data can't be sent to a commercial AI service. If the model runs outside the boundary, the conversation ends there.

02

APPLIANCES ARRIVE AS A FOREIGN OBJECT

A vendor box brings its own identity, networking, storage and update path. None of it matches what your ISSM has already accredited.

03

PILOTS STALL AT INTEGRATION

A model on one workstation is easy. Getting it behind your existing login, on the right segment, with an update process your team can follow is where projects stall.

> *The AI is the easy part. Making it work inside your boundary is the hard part, and that's what we've done for 25 years.*

HOW WE DELIVER FIVE STEPS, INSIDE YOUR BOUNDARY

01

ASSESS

Agree on one use case, the users, the document set and the environment. Write down what is in scope and what isn't.

02

SIZE & SELECT

Recommend GPU, memory and storage for the use case and user count. You buy through your normal channels.

03

INTEGRATE

Connect to the services you already run (sign-in, DNS, certificates, network segment, virtualization) to the extent agreed.

04

DEPLOY

Install air-gapped from transferred media. Load open-source models and index the agreed document set.

05

SUSTAIN

Optional retainer for a defined number of offline update bundles per term.

REFERENCE ARCHITECTURE ILLUSTRATIVE · FINAL DESIGN SET IN ASSESSMENT

YOUR ACCREDITED BOUNDARY · NO OUTBOUND CONNECTION

USERS

— Standard browser on existing workstations

— Sign in with existing credentials (e.g. CAC/PIV)

— No client software to install

→

SERVICES YOU ALREADY RUN

— Directory / SSO for sign-in

— DNS and certificates (PKI)

— Assigned network segment

— Logging to your existing tools, where agreed

→

PRIVATE AI SERVICE

Web interface	Local model server	Document search index

Open-source components on your GPU hardware or virtualization platform. Indexes only the document set approved for use.

UPDATES **OFFLINE BUNDLES** New model versions and component updates, packaged for your existing media transfer process. Nothing is pulled from the internet.

ENGAGEMENT OPTIONS START SMALL. PROVE IT. THEN SCALE.

START HERE · FIXED SCOPE

PILOT

One well-defined use case, one document set and a small user group, deployed inside your boundary on your hardware.

- Assessment and hardware recommendation
- Air-gapped deployment on one system
- Written acceptance criteria, agreed up front
- Readout of results and options

FULL DEPLOYMENT

PRODUCTION

Move a completed pilot, or a clearly defined requirement, into production. Scoped and quoted separately.

- Statement of work with defined deliverables
- Integration items listed by name
- As-built documentation and runbooks
- Technical documentation for your ATO package

OPTIONAL · MONTHLY

SUSTAINMENT

Keep the deployed system current without opening a connection to the outside.

- A set number of update bundles per term
- Covers the components we deployed only
- Packaged for your media transfer process
- Other work quoted separately

Available directly, or as a subcontract through a prime or an OEM professional-services partner. Every engagement is fixed in scope and quoted in writing. Anything outside that scope is a separate quote, agreed before the work starts.

SCOPE AT A GLANCE

INCLUDED

- Hardware recommendation for the agreed use case
- Install and configure open-source models and document search
- Integration items listed in the statement of work
- As-built documentation and a handoff session

NOT INCLUDED

- × Custom application or chatbot development
- × Training or fine-tuning models
- × Cleaning up or reorganizing document repositories
- × Writing or owning your ATO package
- × Buying hardware or user help desk support

YOU PROVIDE

- Hardware installed, powered and on the network
- Accounts, access and a named technical point of contact
- The document set, already approved for use
- Media transfer through your existing process

WHY FALCONROCK SAME BOUNDARY. SAME RULES. NEW WORKLOAD.

For 25+ years we've designed and built infrastructure for DoD and Intelligence Community environments, including offline and air-gapped builds.

Private AI is another workload on that infrastructure, with the same integration problems. The person who scopes the work is the person who builds it.

Principal holds an active TS/SCI clearance · SAM registered · Active subcontractor to a major defense contractor on a DoD program

IDENTITY Active Directory, PKI and CAC/PIV, so sign-in follows the pattern you already use.

NETWORK NSX-T, SD-WAN and Infoblox DDI, so the service fits your network design.

COMPUTE VMware VCF and vSphere, so it runs on a platform your team already supports.

AIR-GAPPED OPS Offline depots, media transfer and Ansible-driven builds that can be repeated.

ACCREDITATION Architecture and as-built documentation designed to support your ATO package. The package itself stays with your security team.

SCHEDULE A 30-MINUTE DISCOVERY CALL

We'll cover whether your use case fits a local model, what a fixed-scope pilot would and wouldn't include, and what you'd need in place first. No obligation. You'll be talking to the engineer who would do the work.
